

PROBLEM STATEMENT

Consumers who submit support complaints often face delays and inconsistent handling, as staff must manually sort large volumes of text where similar wording can signal very different issues. For instance, being "charged" may relate to a billing error or a cancelled subscription. This slows resolution, increases staff workload, and can leave urgent complaints, like fraud or account access issues, waiting alongside routine ones. Our team is building a fine-tuned transformer model to classify complaints into distinct support categories, helping route them faster and more consistently. This solution is guided by accuracy with fairness across all categories, timeliness in addressing consumer concerns, and trust in keeping human judgment involved for sensitive cases. Success means consumers reach the right team without repeating themselves, staff spend less time sorting and more time resolving, and higher-stakes complaints receive the care they deserve.
